

1864.

QUEENSLAND.

FOURTH ANNUAL REPORT

ON

REGISTRATION OF BIRTHS, MARRIAGES, AND DEATHS.

Presented to both Houses of Parliament by Command of His Excellency the Governor.

THE REGISTRAR-GENERAL to THE HONORABLE THE COLONIAL SECRETARY.

Registrar-General's Office,

Brisbane, 16th August, 1864.

SIR,

I have the honor to forward to you for presentation to Parliament, the Fourth Annual Report on the Vital Statistics of Queensland for the year 1863.

The population of Queensland has largely increased during the last three years, and, as a necessary consequence, the births, marriages, and deaths, requiring registration, are far more numerous than formerly. The occupied area of the Colony has also been added to in even a greater ratio than the population. This has necessitated the proclamation of several new Registration Districts, situated at great distances from Brisbane, and with imperfect postal communication; to these causes is to be attributed the delay in the preparation of this document.

The Census taken on the 1st January, 1864, and published on the 1st July, 1864, shows a Population. population on the former day of 61,640 persons, consisting of 37,579 males and 24,062 females and on this basis of calculation the population on the 1st January, 1863, is estimated at 46,300 persons, viz., 28,177 males, and 18,123 females. Of the large increase which is thus shown to have taken place during the past year, this Report has only to deal with that very small portion arising from the excess of Births over Deaths, of which the following is a statement:—

	Males.	Females.	Total.
Excess of Births over Deaths during First Quarter ... ..	32	117	149
Excess of Births over Deaths during Second Quarter ... ..	91	122	213
Excess of Births over Deaths during Third Quarter ... ..	94	202	296
Excess of Births over Deaths during Fourth Quarter ... ..	79	209	288
Total increase during the year ... ..	296	650	946

Comparing the above increase with the mean population of the year estimated at 53,970 persons, viz., 32,878 Males and 21,092 Females, the centesimal increase is of persons, 1·75—Males, 0·55; Females, 1·20. Centesimal increase of the population from natural causes.

The centesimal rates of increase arising from excess of Births over Deaths for each year, since the foundation of the Colony, calculated on the mean population of each year, are as follows:— Centesimal increase for four years.

1860	...	...	...	...	...	...	...	...	...	...	...	2·81
1861	...	...	...	...	...	...	...	...	...	...	...	2·92
1862	...	...	...	...	...	...	...	...	...	...	...	2·27
1863	...	...	...	...	...	...	...	...	...	...	...	1·75

\* The above figures include certain Returns alluded to in a note at foot of Page 6 of Registrar-General's Report on Census of 1864.

Several causes combine to explain the above diminution in the annual rate of increase. First, I am sorry to say, there is a greatly increased mortality; secondly, the proportion of females is diminishing; and, thirdly, there is a gradual increase in the proportionate number of young persons below the marriageable age. The first, however, must be looked upon as the main cause, for although I believe, that in process of years, as population increases, the other two causes would certainly have the effect of reducing the annual rate of increase, until it approximated to the English rate of 1.11, their effects would be far more gradual than appears to have been the case in this instance.

Increase of females.

Whilst on the subject of population, and its increase from natural causes, it may not be out of place to observe the large proportion which females occupy. In the total increase, out of every 100 persons added to the population, 68.71 are females. On turning to table No 2 of the Appendix, it will be observed that a few more females than males were born. This is unusual, the preponderance being generally in favor of the males, and is quite too small an excess to account for the above large difference. If, however, we turn to Table No. 4, it is at once explained; for we there see that out of 1,275 deaths, 798 were of males; that is to say, that out of every 100 deaths, 62.59 are of males. When the large proportion of males in the whole population is taken into account, this great excess disappears, and the small remaining excess is easily explained, by the numerous risks to which men are exposed, but from which females as the rule are exempt. Thus, if we compare the deaths of males with the male population, and the deaths of females with the female population, the difference in the rate of mortality is found to be small, and only slightly to exceed the English rate. The following are the calculations:—

Annual rate of Mortality among Males	...	...	...	...	2.43 per cent
Annual rate of Mortality among Females	...	...	...	...	2.26 „

In other words, in 10,000 males, there occur each year seventeen more deaths than happen in a like number of females, in the same period. The rates of mortality in England, on an average of ten years, are for males 2.32 per cent, for females 2.17 per cent; that is, there were fifteen more deaths per annum in 10,000 males than in the same number of females.

BIRTHS.

Male and female births compared.

The registered Births of the past year number 2,221—males, 1,094; females, 1,127. In the year 1862 the numbers were 1,702 Births—males, 903; females, 799. There is, therefore, a centesimal increase in the year 1863 of 30.49 in the total number of Births. This ratio of increase hardly keeps pace either with the annual increase of the mean population, or of the annual increase of the female portion of it—the former being at the rate of 32.92 per cent., and the latter at the rate of 32.74 per cent.

TABLE showing the NUMBER of BIRTHS in the Years 1862 and 1863; also the PROPORTION of FEMALES to MALES born in each Year.

Births compared with mean population.

Comparing the registered Births of the year with the mean population, estimated to the middle of the year, and calculated on the assumption of a uniform rate of increase, they are in the proportion of one birth to each twenty-four of the population. In England, on an average of twenty two years, the proportions are one birth in each thirty of the population.

<sup>1</sup> Including, also, the three new registration districts, Goondiwindi, Mount Abundance, and Surat. <sup>2</sup> Including also Nanaingo <sup>3</sup> Including Banana, Broad Sound, Peak Downs, Princhester, Rockhampton, and Springsure.

MARRIAGES.

The number of Marriages celebrated in 1863 is 774. In 1862 the number was 570, the increase is therefore at the rate of 35·79 per cent. ; rather more than the rate of increase shown by the population. The two following tables supply full information as regards numbers and social condition of the married, locality and religious denomination of the officiating clergyman.

1863 ...	677	45	32	20	7	183	
Per cent. ...	87·5	5·8	4·1	2·6	0·9	23·6	

Compared with the mean population of the year, one person in every 35 living in the Colony was married last year, that is to say the marriage rate was 2·87 per cent. of the whole population ; in England the marriage rate is 1·64 per cent.

DEATHS.

The mortality of the year 1863 is in excess of any previous year. Comparing the deaths of each year with the mean population of the same period, it appears that, in 1860, the mortality was in the ratio of 1·77 per cent. ; in 1861 it was 1·56 per cent. ; in 1862 it was 2·01 per cent. ; and in 1863, 2·36 per cent. ; in other words, there was, in the year 1863, one death to 42 living in the Colony. In England the average proportion of the twenty-two years, ending with 1859, is one death in 45 living ; from this it appears that our mortality last year was slightly greater than is found to be the

<sup>1</sup> Including the Marriages registered in the new districts of Goondiwindi, Mount Abundance, and Surat.  
<sup>2</sup> Including Nanango.  
<sup>3</sup> Including Banana, Broad Sound, Peak Downs, Princhester, and Springsure.

case in England. The most intelligible form in which to put this statement is, that out of every 10,000 of our population 12 more persons die than out of a like number in England. The following table compares the deaths of the two years, 1862 and 1863.

DEATHS in the Years 1862 and 1863.

	1862.			1863.			Number of Deaths in 1863 for every 100 Deaths in 1862.	Number of Deaths of Females to every 100 Deaths of Males in 1863.

Comparison between the mortality of Queensland and England.

The following table is compiled for the purpose of facilitating a comparison between the Queensland mortality, at various ages, during the last four years, and the results of a similar calculation made in England in the year 1859. First, as regards the Queensland mortality of infants below one year old, it will be observed that the proportion they bear to the whole number of deaths, has diminished from 29·50 per cent to 25·80 per cent; this decrease is, therefore, compensated in the more advanced ages, each subsequent period showing a larger proportion than was the case in any of the previous three years. Within a small fraction (·82 per cent.), one-half the deaths of the Colony are of persons below the age of five years:—

TABLE showing the RATIOS that DEATHS below various ages bear to the whole number of Deaths during each of the Years 1860, 1861, 1862, and 1863.

	In England, in 1859, the per centage of deaths to the whole deaths of the year ... ..	23·92	41·76	46·40	51·92	Under 55 Years. 74·01	55 and upwards. 25·99		

Average age at time of death.

The following table gives the average age of males, of females, and of persons who died during the past year, distinguishing between the metropolitan and the other registration districts of the Colony.

DISTRICTS.	MALES.			FEMALES.			PERSONS.		
	Number of Deaths.	United Ages in Years.	Average Age at Death in Years.	Number of Deaths.	United Ages in Years.	Average Age at Death in Years.	Number of Deaths.	United Ages in Years.	Average Age at Death in Years.
Metropolitan District ... ..	266	3,534	13·29	224	2,839	12·68	490	6,373	13·01
Other Districts ... ..	485	11,095	22·88	245	2,700	11·02	730	13,795	18·90
The whole Colony ... ..	751	14,629	19·48	469	5,516	11·76	1,220	20,168	16·53

<sup>1</sup> Including also the three new registration districts of Goondiwindi, Mount Abundance, and Surat.  
<sup>2</sup> Including also Nanango.  
<sup>3</sup> Including Banana, Broad Sound, Peak Downs, Princhester, Rockhampton, and Springsure.

A reference to No. 3 of Table No. 5 in the Appendix will explain the basis of the above calculations, where it will be seen that the age at death was specified in 1,220 out of the 1,275 deaths registered. The united ages of these 1,220 persons amounted to 20,168 years; their average age at death was, consequently, 16·53 years. There is reason to believe that the majority of the 55 deaths, at an age not specified in the registers, were the deaths of adults, so that the average ages in the table, though almost rigorously exact for the 1,220 cases analysed, are probably a little under those which would be deduced from an examination of all the deaths during the year. It will be observed that the table confirms what is known from other sources respecting the ages and distribution of the population.

The well-defined causes of Death of most frequent recurrence in the registers for the year 1863, are arranged in the order of mortality in the subjoined table. The number of 1,000 Deaths has been taken to facilitate comparison with the proportional numbers given in a similar table by Dr. William Farr, in his analysis of the Causes of Death in England and Wales in the year 1859. Dr. Farr's assumed number is 1,000,000 deaths,—his proportional numbers have, therefore, been divided by 1,000. The proportional numbers are accurate to the nearest unit, and are round numbers only to the extent of an omitted or added fraction, always less than half the unit

Causes of Death.	Number of Deaths registered in 1863.	Proportional number from each cause to 1,000 Deaths from All Causes, in Queensland, in 1863.	Proportional number from each Cause to 1,000 Deaths from All Causes in England, in 1859.

<sup>1</sup> One child specified only as below 2 years of age is, from the construction of the Nosological Tables in the Appendix, necessarily classed as of unspecified age.

Deaths of children in Queensland compared with deaths of children in England.

Assuming for the children under five years, in the population estimated to the middle of the year, a number proportional to that ascertained by the Census at the end, there would be 8,050 such children, the deaths of 628 of whom were registered; their annual death-rate was, therefore, 7·80 per cent. In England in 1859 the rate of mortality under five years, was 6·95 per cent., the mortality in Queensland being higher by 0·85 per cent., or 85 more deaths among 10,000 children than in England. At the English rate for 1859, instead of 628 deaths under five years, there would have been 559, or 69 fewer deaths. Of the 628 deaths of children, the *causes* of 573 were specified so as to admit of classification. The more fatal causes of death among children, during the year, are arranged in the order of mortality, in the following table.

Causes of Death.	Number of Deaths under 5 years registered in 1863.	Proportional number from each cause to 1,000 Deaths under 5 years from all causes in Queensland in 1863.	Proportional number from each cause to 1,000 Deaths under 5 years from all cause in England in 1859.

Final remarks.

The death rates of the last four years, as given at page three, tend to prove the existence during the past year of an unusually great mortality, particularly among children; and it also appears that if we except the single district of Rockhampton, in which town the deaths are, as compared with its population, twice as numerous as in any other district of the Colony, the mortality of the country districts is greater than that of those districts containing comparatively large urban populations; thus, the deaths in the Brisbane district are in the ratio of 2·46 per cent. to its population; in the Ipswich district 1·52; in the Maryborough district 1·89 per cent.; whilst in the other districts, excepting Rockhampton, the average per centage is 2·92. There is no doubt that many causes operate to produce this large mortality, and that if the towns suffer, as I have no doubt they do, from bad drainage, and from the decomposition of animal and vegetable matter permitted to accumulate in them, the country suffers fully as much from the prevalence of diseases peculiar to newly occupied and undrained districts, and, in addition, from the difficulty of obtaining medical assistance.

assistance. However this may be, it is certain that the mortality of last year exceeds the average mortality of England, and although the actual difference, as shown by figures, is not great, we must not forget the very different position of the two countries as regards pauperism and all its attendant miseries of destitution, starvation, filthy, crowded, and unwholesome dwellings, and consequent disease; if a fair deduction could be made for the deaths arising from this cause, happily almost unknown in Queensland, it would make the difference in the mortality of the two countries far greater.

Taking into consideration the salubrious climate of Queensland, the small number of aged persons, the abundance of wholesome food, the immunity from pauperism, the absence of large overcrowded towns, and of nearly all occupations injurious to health, it seems clear that our rate of mortality is far greater than it should be. Examining the returns, we find that out of 1,275 deaths, only 5 died of old age, and that the large proportion of 1,270 died prematurely, or from causes remediable to a greater or less extent. Let us suppose that we possess the means and the knowledge, if we employed them, of diminishing the above mortality by one half, here is at once a saving of 600 valuable lives in a single year; if it be believed that this estimate of our powers of prevention or cure be too great, although it would only restore the mortality of the Colony to its ratio of former years, we will, for the sake of argument, be content with reducing the number of lives saved to 300, or even to 100, even at this last minimum rate how much suffering would our small community be spared? How many parents would not be childless? How many wives or children would still be supported by the labors of their natural protectors, instead of being thrown on the charity of relatives, or left as burdens on the public? And, lastly, how serious is the responsibility of the community which shuts its eyes and neglects to employ the remedial powers within its reach? If any accident involving loss of life occurs, what searching inquiries are made—what public indignation is expressed, and even punishment inflicted, if negligence or carelessness can be shown to have occasioned it—and yet each week sees quietly withdrawn from our community a certain number, many of whose lives might probably by ordinary care and attention be lengthened for years; and this quiet stream of death is permitted to flow on unchecked, almost unnoticed, until, in a few months, it has swept away far more numerous victims than are sacrificed in the most frightful accidents on land or sea.

In support of the above assumption, that many lives might be lengthened by human means and foresight, I have prepared the following table comparing the average age at death in this Colony, as given at page four, and the average age at death in five districts in England, three of them in London, one embracing the agricultural county of Wiltshire, and one in the mining district of Kendal, compiled and published in 1859, by Mr. Chadwick in his sanitary report; the figures I shall leave to speak for themselves, only observing, that stronger proof cannot be produced of the urgent need of sanitary regulations and reform.

ENGLAND.

	Number of Deaths.	Average Age at Death.
Whitechapel Union ... ..	2,186	23·26 years
Strand Union ... ..	981	27·48 "
Kensington Union ... ..	1,937	29·60 "
Unions in the county of Wilts ... ..	2,398	35·20 "
Kendal Union ... ..	603	36·09 "

QUEENSLAND.

	Number of Deaths.	Average Age at Death.
Metropolitan District... ..	490	13·01 years
Other Districts ... ..	730	18·90 "
The whole Colony ... ..	1,220	16·53 "

Were I to dwell on this subject as fully as its importance deserves, I should quite overstep the usual limits assigned to reports of this nature, I can only hope that the few remarks I have made may be the means of drawing attention to a great, and I fear, growing evil, but one which I believe it to be quite within our power to curb, by employing in Queensland, more especially in its sea-port towns, those sanitary regulations and appliances which experience, in older communities, has shown to be so effective, and which, even in this beautiful climate, we cannot dispense with.

In conclusion, I beg to draw your particular attention to the valuable assistance I have received from Mr. Benjamin Reynolds, who acted for the Deputy Registrar-General during his absence, and by whom the tables appended to, and most of the tables embodied in, this report have been compiled.

Conclusion.

I have the honor to be,  
Sir,  
Your obedient Servant,

F. O. DARVALL,  
Registrar-General.

APPENDIX TO REGISTRAR-GENERAL'S REPORT ON THE VITAL STATISTICS OF QUEENSLAND, FOR THE YEAR 1863.
